

CLAIMS

1. A method for detecting and quantifying an oxidizable contaminant in a gas
2 stream at a low concentration level which comprises:
 - a. subjecting at least a portion of said gas stream to an oxidation reaction
4 under conditions sufficient to effect complete oxidation of said contaminant to an
oxidized product whose presence is more readily detected and quantified than
6 is said contaminant at said low concentration level;
 - b. determining the quantity of said oxidized product in said portion after said
8 complete oxidation; and
 - c. determining from said quantity of oxidized product the concentration of
10 said oxidizable contaminant in said portion from the stoichiometry of the
oxidation reaction.
2. A method as in Claim 1 wherein said oxidizable contaminant is selected
2 from the group consisting of hydrocarbons, siloxanes, organosilanes,
organosulfides, organophosphides and organohalides.
3. A method as in Claim 2 wherein concentration of said oxidizable
2 contaminant is reduced to less than 1000 ppt.
4. A method as in Claim 3 wherein concentration of said oxidizable
2 contaminant is reduced to less than 500 ppt.
5. A method as in Claim 4 wherein concentration of said oxidizable
2 contaminant is reduced to less than 100 ppt.
6. A method as in Claim 5 wherein concentration of said oxidizable
2 contaminant is reduced to less than 10 ppt.

7. A method as in Claim 1 wherein said subjecting comprises contacting said
2 portion to contact with an oxidation catalyst under conditions sufficient to effect
complete catalytic oxidation of said contaminant to an oxidized product.
8. A method as in Claim 7 wherein said oxidation catalyst comprises a
2 transition metal or lanthanide metal or combinations thereof.
9. A method as in Claim 7 wherein said oxidation catalyst is supported on
2 an oxygen-rich inorganic substrate or present as an alloy or solid solution.
10. A method as in Claim 9 wherein said substrate comprises zirconia, ceria,
2 or alumina.
11. A method as in Claim 1 wherein said oxidation product has a higher
2 concentration in said portion after oxidation than did said contaminant prior to
oxidation.
12. A method as in Claim 1 wherein said oxidation product is effectively
2 detectable and quantifiable at lower concentrations in said portion than is said
contaminant.
13. A method as in Claim 1 wherein sufficient oxygen for said complete
2 oxidation comprises oxygen or air which is present in said portion of said gas
stream.
14. A method as in Claim 1 wherein said portion of said gas stream contains
2 insufficient oxygen for said complete oxidation and said method further
comprises adding free oxygen or air to said portion prior to said complete
4 oxidation.

15. A method as in Claim 1 wherein said contaminant comprises a
2 hydrocarbon at a concentration of less than 3000 ppt and said oxidation product
comprises at least one of water or carbon dioxide.

16. A method as in Claim 1 further comprising a plurality of oxidizable
2 contaminants in said gas stream.

17. A method as in Claim 16 further comprising selectively quantifying
2 concentrations of contaminants within said plurality by controlling conditions of
said oxidation such that less than all of said plurality of said contaminants are
4 completely oxidized.

18. A method as in Claim 17 wherein said oxidation is by contact of said
2 portion with an oxidation catalyst and controlling conditions comprises
maintaining temperature at which said contact occurs within a temperature range
4 at which less than all of said plurality of contaminants are catalytically oxidized.

19. A method as in Claim 1 wherein said contaminant comprises a
2 hydrocarbon of unknown identity and said method further comprises determining
the saturation ratio of said hydrocarbon from analysis of the oxidized product,
4 such that identity of said hydrocarbon may thereafter be determined.

20. A method as in Claim 1 wherein said steps a., b. and c. are accomplished
2 by means embodied in a compact transportable system.
